

Tennessee Drought Update

For the assessment period ending March 5th, 2024

Statewide Condition Summary

This Week's Drought Monitor of Tennessee Map

From the US Drought Monitor, authored by Curtis Riganti, NDMC with input from the Tennessee Climate Office

Lack of significant rainfall has led to abnormally dry conditions developing in northwest Tennessee

D0 – D2 conditions persist across West and Middle Tennessee, and the Cumberland Plateau

What's Changed? Drought conditions continue to persist across the majority of the state this week; however, northwest Tennessee has started drying out due to the lack of rainfall and the fast draining soils of the region. The system that brought 1 – 2 inches of rainfall across the TN-KY border over the past week (Tuesday to Tuesday) seemed to miss the northwest corner of Tennessee. Soil moisture saw another decrease since last week across the majority of the state. Streamflow rates are also continuing to decrease, predominately across the western and southern regions of Tennessee.

What's New? D0 areas have expanded across Lake, Dyer and Obion county.

What's Next? Over the next 7 days, forecasts are predicting some much-needed rainfall across the state. The heaviest rainfall (1.5 – 2 inches) is predicted to fall over Middle and West Tennessee and the Cumberland Plateau.
